File Handling:

A file handling is a connection between your python program and file stored on your computer

Why do we need this ?

Python cannot have access to red/write directly to the harddisk--> it uses "handle" to communicate ..

How are you
I am fine

f=open("dta.txt") # f is file handle

1. Opening a file using Open ()
   Open(filename,mode) --> filename="mention the file with complete path"
   c:/user/filename.txt .. Mode:-> how you want to access the file? (read/write….)

   File Modes:

Mode	Meaning	Files exists	File created
"r"	Read only	**Yes**	**No**
"w"	Write (overwritten)	**No need**	**Yes creates**
"a"	Append	**No need**	**Yes create**
"r+"	Read+write	**Yes**	**No**
"w+"	Write + read(overwritten)	**No**	**Yes**
"a+"	Append + read	**No**	**Yes**
